The Green Egg Way

Ten electronic eggs that identify trauma points in order to minimise cracked eggs. The entire journey from nest to tray is assessed several times and an average is then taken.

Adjustments are then made to transfer points where necessary, and bump strips and detectors installed. A diagnostic report is provided both before and after improvements

Egg handling and packing processes

The GreenEggway assessment includes:

- Diagnostic check of the nests, belts and conveyors at multiple points.
- Adjustments made to the structure of the nest.
- Adjustments made to transfer points.
- Installation of cushioned rubber strips at strategic points.
- The customer is provided with a full diagnostic report showing trauma points before and after the service.
- If a packer is present, the EggWay assessment will include the egg transit to trays.

When the Gregg is started on the X, Y and Z axis accelerations will be registered

The data will be analysed and a report is generated

When stopped the registered data will be send to the computer/smartphone.
